📊 Power BI Project: Superstore Business Dashboard

🚀 Project Overview

This project focuses on building an interactive Power BI dashboard using the Superstore dataset to analyze sales performance, profitability, and customer insights.

Step 1: Data Loading

- Open Power BI Desktop
- Go to **Home → Get Data → Text/CSV**
- Select Superstore.csv
- Click **Load**

🛠 Step 2: Data Cleaning (Power Query)

- Click **Transform Data** to open Power Query Editor

  Fix Headers

  - Click **Use First Row as Headers**

  Fix Date Columns (Important)

  - Right click Order Date → Change Type → **Using Locale**
    - Data Type: Date
    - Locale: English (United States)
  - Repeat for Ship Date

  Fix Data Types

  - Sales → Decimal Number
  - Profit → Decimal Number
  - Quantity → Whole Number

  Apply Changes

  - Click **Close & Apply**

Step 3: Create DAX Measures

Go to **Modeling → New Measure**

Total Sales	Total Sales = SUM('Superstore'[Sales])
Total Profit	Total Profit = SUM('Superstore'[Profit])
Total Orders	Total Orders = COUNT('Superstore'[Order ID])

Step 4: Create Time Column

Month-Year Column	MonthYear = FORMAT('Superstore'[Order Date], "MMM YYYY")
Month Number (for sorting)	MonthNumber = MONTH('Superstore'[Order Date])

Sort MonthYear

- Select MonthYear column
- Click **Sort by Column → MonthNumber**

Step 5: Create Visualizations

KPI Cards

- Add Card Visual
- Drag:

    - Total Sales
    - Total Profit
    - Total Orders

Sales by Category (Bar Chart)

- Axis → Category
- Values → Total Sales

Sales by Region (Pie Chart)

- Legend → Region
- Values → Total Sales

Monthly Sales Trend (Line Chart)

- Axis → MonthYear
- Values → Total Sales

Step 6: Add Filters (Slicers)

Region Filter

- Add **Slicer**
- Field → Region

Category Filter

- Add Slicer
- Field → Category

Step 7: Dashboard Design

- Arrange visuals in structured layout:
    - KPI Cards on top
    - Charts in middle
    - Line chart below
    - Filters at bottom
- Remove duplicate visuals
- Align and resize charts properly

Key Insights

- Identified top-performing product categories
- Analyzed regional sales distribution
- Observed monthly sales trends and seasonality
- Identified high-value customers and revenue drivers

💬 **Conclusion**

This dashboard provides an interactive view of business performance, enabling stakeholders to make data-driven decisions using real-time filtering and visualization.

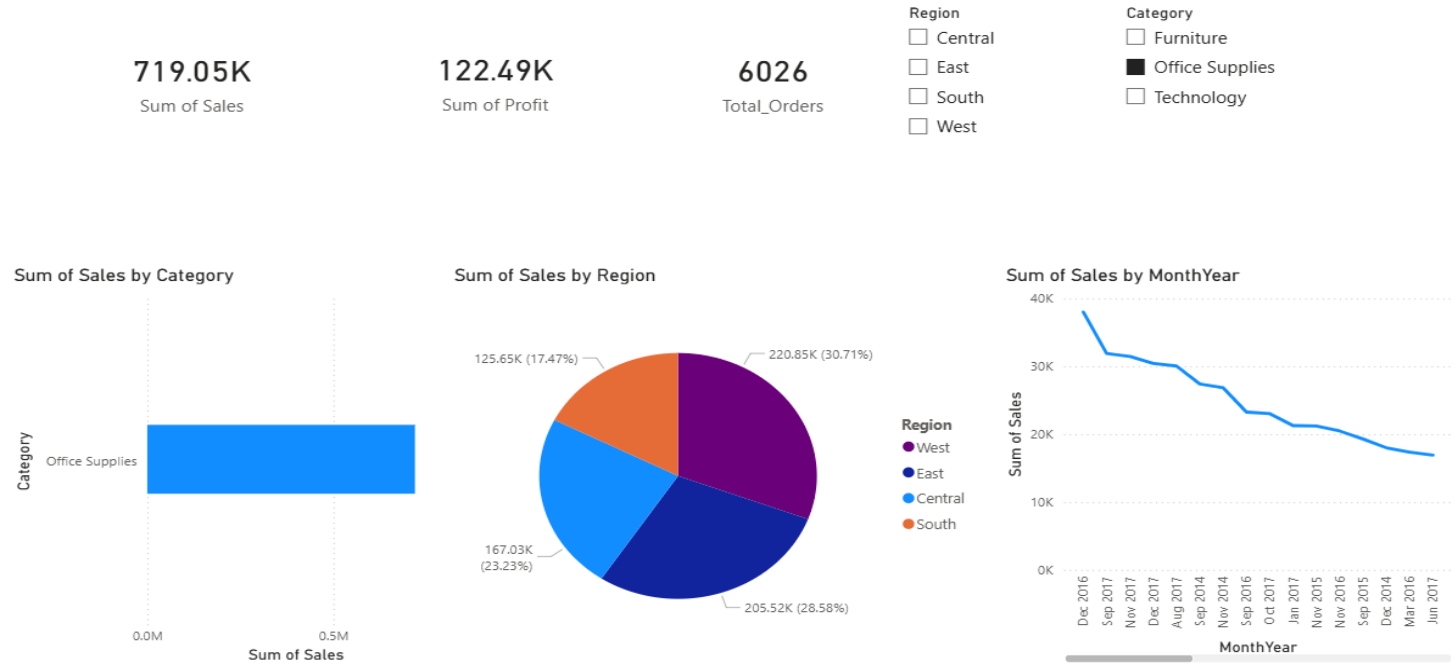
Tools Used

- Power BI
- Power Query
- DAX

Skills Demonstrated

- Data Cleaning
- Data Transformation
- Data Visualization
- DAX Calculations
- Business Analysis

Final Outcome

An interactive Power BI dashboard that allows users to:


- Track KPIs
- Analyze trends
- Filter data dynamically
- Generate actionable insights
